"IPPA TREE — THE ADIVASI'S LIVING KALPAVRIKSHA — A WARNING TO THE GENERATION THAT FORGOT ITS ROOTS"

Dr. G. Shekhar
Assistant Professor, Government Degree College Yellandu

Article DOI: https://doi.org/10.36713/epra27151
DOI No: 10.36713/epra27151

ABSTRACT

*The Ippa tree (*Madhuca longifolia*), known as Mahua in Hindi and Iluppai in Tamil, stands as one of the most significant yet increasingly overlooked trees in India's ecological and cultural landscape. For centuries, Adivasi and tribal communities across central and southern India have depended on this remarkable tree as a source of food, medicine, livelihood, and spiritual identity — earning it the revered status of* Kalpavriksha*, the wish-fulfilling tree of tribal life.*

This article examines the multi-dimensional importance of the Ippa tree across botanical, nutritional, medicinal, cultural, and economic dimensions. Scientifically classified under the family Sapotaceae, the tree thrives across tropical deciduous forests of India, Nepal, Sri Lanka, and Myanmar. Every part of the tree serves a purpose — its flowers are consumed fresh, dried, and fermented into the traditional Ippa Sara (Mahua liquor); its seeds yield a rich edible oil used in cooking, cosmetics, and biodiesel; its bark possesses proven anti-inflammatory, antidiabetic, and hepatoprotective properties; and its leaves serve as fodder and support tassar silk production.

Nutritionally, dried Mahua flowers contain approximately 15 mg of iron and 140 mg of calcium per 100 grams, surpassing commonly celebrated super foods. Traditional preparations like Ippa Laddu represent both cultural heritage and practical nutritional intervention against tribal malnutrition. Mahua flowers and seeds contribute an estimated ₹3,000 to ₹5,000 crore annually to India's tribal economy.

However, rapid deforestation, overexploitation, climate change, and generational knowledge loss threaten this ancient relationship between tree and community. This article serves as both documentation and warning — urging policymakers, conservationists, and younger generations to recognize, protect, and revive the irreplaceable legacy of the Ippa tree before it is lost forever.

KEY WORDS: *Ippa Tree, Madhuca longifolia,Mahua, Kalpavriksha, Adivasi Livelihood,Tribal Heritage, Ippa Sara, Ippa Laddu, Mahua Oil, Medicinal Plants, on-Timber Forest Produce, Tribal Economy, Ethno botany, Forest Conservation, Traditional Knowledge*

1. INTRODUCTION — A TREE THAT BELONGS TO THE PEOPLE

Walk into any forest in central India between February and April, and you will know the Ippa tree before you even see it. A thick, honeyed fragrance drifts through the air — sweet, warm, almost intoxicating — long before the tree comes into view. That scent comes from thousands of small, fleshy cream-coloured flowers lying freshly fallen on the forest floor at dawn, waiting to be gathered by hands that have known this ritual for generations.

The Ippa tree — called Mahua in Hindi, Iluppai in Tamil, Ippa or Vippa in Telugu — is not just another forest species. For the Adivasi communities of India, it is life itself. It has fed families through droughts, healed the sick when no doctor was within a hundred miles, provided lamp oil in the darkness, and given cause to celebrate at every harvest and wedding. The tree has even been inherited — in many tribal families, the right to collect flowers from a particular Ippa tree was passed from parent to child the way a piece of land or a piece of jewellery might be in other communities. That is how deeply this tree is woven into human life.

Scientifically known as Madhuca longifolia, belonging to the family Sapotaceae, the Ippa tree stands as one of the most thoroughly useful trees in the world. Its flowers are eaten, fermented, and distilled. Its seeds yield a rich edible oil. Its bark cures fevers and heals skin. Its wood builds homes. Its leaves feed cattle. Even the leftover seed cake after oil extraction finds use as fertilizer and fish pond treatment. There is almost nothing about this tree that goes to waste.

This article tells the full story of the Ippa tree — where it grows, what it is called, how long it has been part of human history, what science says about its nutritional and medicinal value, how communities use it today in the beloved Ippa Sara (Mahua liquor) and Ippa Laddu (Mahua sweet), and why this ancient tree deserves a bright place in India's future.

2. WHAT KIND OF TREE IS THE IPPA? — BOTANICAL IDENTITY

2.1 Scientific Classification

Before we speak of its beauty and bounty, let us place the Ippa tree where it belongs in the family of plants:

Kingdom	Plantae
Division	Magnoliophyta (Angiosperms)
Class	Magnoliopsida (Dicotyledons)
Order	Ericales
Family	Sapotaceae
Genus	Madhuca
Species	M. longifolia
Full Scientific Name	Madhuca longifolia (J. Koenig) J.F. Macbr.
Botanical Synonyms	Bassia longifolia L.; Madhuca indica J.F. Gmel.; Illipe latifolia (Roxb.) F. Muell.
Common English Name	Butter Nut Tree; Indian Butter Tree; Mowrah Tree
Lifespan	Productive for 60+ years after reaching maturity (~10 years)

2.2 How the Tree Looks

The Ippa tree is a big, generous tree — and it looks the part. A healthy, mature specimen can reach 15 to 20 metres in height, with some old trees touching 25 metres, their trunks so thick that three people stretching their arms cannot encircle them. The bark is grey-brown and rough, cracked in horizontal lines like the face of a wise elder, peeling off in thin irregular flakes. Beneath that rough exterior, the inner bark is reddish and aromatic.

The leaves appear clustered at the tips of branches — broad, oblong, and glossy green. But what makes the tree truly striking is how the new leaves emerge each spring: they come out a dusty, tender pink, almost as if the tree is blushing, before slowly deepening to their final dark green. The flowering season, from late January through April, is the tree's finest moment. Thousands of small, waxy, cream-to-yellowish flowers open overnight and fall by dawn, carpeting the ground beneath the tree in a soft, sweetly scented layer that forest communities call the morning harvest.

After flowering, greenish oval fruits develop — about 3 to 5 cm long — containing one to four shiny, oily brown seeds. These seeds are every bit as important as the flowers, yielding a thick, golden-yellow oil that has been pressed and used in tribal kitchens and medicines for thousands of years.

What also distinguishes the Ippa tree is its remarkable patience and longevity. It takes about ten years to begin flowering properly, but once it does, it keeps giving for sixty years or more. A single mature tree drops 100 to 150 kilograms of flowers and 60 to 80 kilograms of seeds every season, without fail, year after year.

2.3 Two Main Varieties

- Madhuca longifolia var. longifolia — the southern variety, more commonly called Ippa or Iluppai, found in peninsular India from Andhra Pradesh and Telangana down through Tamil Nadu and Karnataka
- Madhuca longifolia var. latifolia — the northern variety, more commonly called Mahua or Mohua, found across the central and northern tribal belts of Chhattisgarh, Jharkhand, Odisha, Madhya Pradesh, and Bihar

3. A THOUSAND NAMES FOR ONE BELOVED TREE

One of the most telling signs of how deeply embedded a plant is in a culture is how many names it carries. The Ippa tree has dozens — each one a small window into a community's relationship with it:

Language / Region	Local Name	Notes
Telugu (Andhra & Telangana)	Ippa / Vippa	Most beloved name among Koya and Kondareddi tribes
Hindi	Mahua / Mahwa / Mohua	Heard across the forests of Central India
Tamil	Iluppai / Nattiluppai	Sacred tree of South Indian temples
Kannada	Ippe / Hippe	Karnataka tribal forests
Malayalam	Iluppa / Poonam	Used in Kerala Ayurvedic traditions
Marathi	Moha / Mahu / Muvda	Pawari tribal dialect: Muvda (Nandurbar)
Gujarati	Mahudo / Mahuda	Bhil tribal areas of Dang and Dediapada
Bengali	Moulo / Mohulo	Santhal Parganas, Jharkhand border belt
Odia	Mahula / Moula	Koraput and Bolangir tribal heartland
Sanskrit	Madhuka / Madhupa	Ancient Vedic and Ayurvedic scriptures
Gondi (tribal)	Madkam	Language of the Gond people, Central India
Punjabi	Mahua	Northern belt communities
Rajasthani	Dolma / Mahwa	Mewadi and Marwari speakers

ISSN (Online): 2455-3662
EPRA International Journal of Multidisciplinary Research (IJMR) - Peer Reviewed Journal
Volume: 12| Issue: 4| April 2026|| Journal DOI: 10.36713/epra2013 || SJIF Impact Factor 2026: 8.753 || ISI Value: 1.188

English	Butter Nut Tree / Indian Butter Tree	Named for the oil-rich seeds
Sinhala (Sri Lanka)	Mee	Used in traditional Sri Lankan medicine
Myanmar	Theepan	Central dry zone forest communities

The fact that almost every language group in India has its own deeply familiar name for this tree — not a borrowed or formal one, but a native word that has existed for centuries — tells us something important: the Ippa tree did not arrive as a stranger. It grew up alongside the people.

4. WHERE THE IPPA TREE GROWS — FROM INDIAN FORESTS TO THE WORLD

4.1 Across India

The Ippa tree is, at heart, a tree of India's great tropical heartland — the belt of dry and moist deciduous forests that stretches across the centre and south of the country. It loves warmth, tolerates drought better than most trees, and asks for almost nothing in return for everything it gives. You will find it growing:

- Chhattisgarh — Bastar, Surguja, Rajnandgaon; arguably the single richest Mahua region in India, where entire tribal economies revolve around this one tree

Jharkhand — Santhal Parganas, Ranchi, Singhbhum; the Santhal people have harvested Mahua here for thousands of years

- Madhya Pradesh — Mandla, Balaghat, Betul, Shahdol; the commercial heartland of the Mahua flower trade
- Odisha — Koraput, Bolangir, Sundergarh, Mayurbhanj; critical to the food security of tribal communities here
- Andhra Pradesh and Telangana — the Eastern Ghats and their foothills; called Ippa by Koya and Kondareddi tribes
- Maharashtra — Gadchiroli, Nandurbar, Amravati; tribal cooperatives here now make Mahua jam and Mahua laddu commercially
- Gujarat — Dang, Dediapada; Bhil and Rathwa communities depend on it heavily
- Bihar — Palamau, Rohtas, Singhbhum; ancient Mahua trade routes passed through here
- West Bengal — Bankura, Purulia; Santhal and Lodha communities
- Tamil Nadu and Karnataka — Western Ghats foothills and Deccan transition zones

Across India, Mahua trees are estimated to cover over three million hectares of forest land. It is, by almost any measure, the most economically significant non-timber forest produce tree in the country.

4.2 Beyond India

The Ippa tree does not stop at India's borders. It grows, often in smaller numbers, across several neighboring countries, and its close relatives are found even further afield:

- Nepal — in the Terai lowland forests and the lower Himalayan foothills; Chitwan and Bardia regions are known for it
- Sri Lanka — in the dry lowland zones, where it is called Mee and is a part of traditional Sinhalese herbal medicine
- Myanmar — in the central dry zone forests, where local communities use both flowers and seeds
- Bangladesh — in the Sylhet and Chittagong Hill Tracts
- Southeast Asia — related species like Madhuca utilis and Madhuca betis are found in Malaysia, Indonesia, and the Philippines, where their seeds are commercially harvested as a cocoa butter substitute
- East Africa — a related species, Madhuca africana, is found in East and Southern African forests

The genus Madhuca itself contains around 100 species spread across tropical Asia and Africa, though Madhuca longifolia remains the most celebrated and most used of them all.

4.3 What Conditions Does It Need?

If you wanted to describe the ideal home for an Ippa tree, you would say: warm, sometimes dry, not waterlogged, and not too fussy about the soil. It thrives in temperatures ranging from 2 to 46 degrees Celsius, prefers an annual rainfall of 550 to 1,500 mm, and can grow at altitudes from sea level up to 1,200 metres. Most remarkably, it can push roots into degraded rocky soil, salt-affected wastelands, and even the thin crevices between boulders where almost nothing else will grow — a quality that makes it one of the most valuable trees for land restoration work.

5. A TREE WITH A 3,000-YEAR WRITTEN HISTORY

5.1 In Ancient Texts and Scriptures

The Ippa tree appears in some of the oldest written records in human history. Its Sanskrit name, Madhuka, comes from the root Madhu, meaning honey or sweetness — and that name appears repeatedly in texts going back three thousand years and more.

In the Charaka Samhita, one of Ayurveda's oldest and most authoritative texts (c. 600 BCE), the Madhuka tree's flowers, bark, and seeds are listed as important medicines. The Sushruta Samhita describes the oil pressed from Mahua seeds as a treatment for skin diseases and rheumatism. Kautilya's Arthashastra, the 4th century BCE treatise on governance and economics, lists Madhuka wine as a taxable commodity — meaning it was a recognised trade item with enough commercial significance to figure in the state's revenue calculations.

Buddhist, Jain, and Hindu literature all make mention of wine prepared from Madhuka flowers. One of the most striking references comes from the Mahanirvana Tantra, a Tantric scripture, which describes the god Mahakala dancing in divine intoxication after drinking wine made from the Madhuka flower

ISSN (Online): 2455-3662
EPRA International Journal of Multidisciplinary Research (IJMR) - Peer Reviewed Journal
Volume: 12| Issue: 4| April 2026|| Journal DOI: 10.36713/epra2013 || SJIF Impact Factor 2026: 8.753 || ISI Value: 1.188

— a passage that tells us the tree had not just economic but spiritual significance in ancient India.

The Atharva Veda associates the tree with fertility and abundance. The Rigveda mentions its sweetness. And in several temples of South India — including the Irumbai Mahaleswarar Temple and the Iluppaipattu Neelakandeswarar Temple — the Madhuka or Iluppai is the presiding sacred tree of the temple compound. The Tamil philosopher-poet Thiruvalluvar is traditionally said to have been born beneath an Iluppai tree at Mylapore — a detail that has given the tree an enduring place of honour in Tamil culture.

5.2 In the Lives of Tribal Communities — A Heritage Older than Writing

But the written record is only part of the story, and perhaps the smaller part. Long before anyone wrote anything down, the Adivasi peoples of central and southern India had built their entire relationship with the forest around this tree.

In many tribal communities, the right to collect Mahua flowers from specific trees was a form of property — inherited, protected, and treated with the seriousness of land ownership. If a family had no son, a daughter would receive her father's Mahua tree harvesting rights as part of her dowry. This was wealth, real and tangible, passed from one generation to the next.

Among the Gond people, there is a saying that captures the tree's mythical status perfectly: Iruk Pungar Anant Hai — the Mahua flower is immortal. This is not mere poetry. The Gond people observed something real: a dried Mahua flower placed in water comes back to life, swells, and releases its fragrance again, no matter how long it has been stored. For a people who lived close to the rhythms of nature, this was a profound sign. The tree's first bloom each season was celebrated with singing, ritual offerings, and communal prayer. Cutting down a Mahua tree in many tribal traditions was considered sinful — something close to killing a member of one's own family.

5.3 The Colonial Period — A Tree Caught in the Middle

When the British arrived and extended their control over India's forests, the Mahua tree became a site of conflict. The colonial administration imposed heavy taxes on Mahua liquor and, at various points, outright banned its home distillation. The stated reason was temperance; the real reason, historians have argued, was control — destroying the economic self-sufficiency of tribal communities and redirecting revenue to government-licensed liquor shops that sold British-controlled products.

Tribal resistance to Mahua liquor laws was fierce and persistent. The tree had become, in a very real sense, a symbol of tribal sovereignty — of the right of forest people to their own forest, their own economy, and their own culture. That symbolism never entirely faded. Even today, in debates about tribal rights and forest governance in India, the Mahua tree appears as a shorthand for the broader question of whether tribal communities have the right to their own resources.

6. EVERY PART HAS A PURPOSE — THE USES OF THE IPPA TREE

6.1 The Flowers — The Most Precious Harvest

The flowers of the Ippa tree are the centrepiece of its usefulness, and the community of uses built around them is remarkable. At their most basic, the flowers are food. They are rich in natural sugars and have a sweet, slightly fermented taste when fresh. Forest communities have eaten them for as long as memory runs — chewed fresh from the ground in the morning, cooked into halwa with ghee and jaggery, stirred into kheer, flattened into meethi puri, or pressed into barfi. During famines and droughts, when grain ran short, Mahua flowers kept families alive.

Beyond eating them fresh, the flowers can be dried and stored for months. Sun-dried Mahua flowers retain most of their nutrition and can be ground into flour for bread. In the Gadchiroli district of Maharashtra, tribal cooperatives now produce Mahua jam commercially. In Bihar, sun-dried Mahua flowers are ground and used to make bread for the whole family. The flower is also used as cattle feed — and dairy farmers have long noted that cows fed Mahua flowers produce richer, more abundant milk.

6.2 Mahua Oil — Liquid Gold from the Seeds

The seeds of the Ippa tree contain 35 to 50 percent oil by weight — a thick, golden-yellow oil that has been pressed and used by tribal communities for centuries. Known variously as Mahua oil, Mowrah butter, or Indian butter, this oil is one of the most versatile plant-based oils anywhere in the world.

In tribal kitchens, it has long served as cooking oil, with a mild, buttery flavour. But it goes far beyond the kitchen. It is the primary ingredient in traditional soap-making across tribal central India. It has been used as lamp oil — lighting homes in the darkness before electricity arrived. Applied warm to the skin, it relieves eczema, dry skin, and chronic joint pain. As hair oil, it is said to strengthen the scalp and prevent premature greying.

In the modern world, Mahua oil has attracted serious attention as a biodiesel feedstock — it meets international quality standards and can be grown on degraded land without competing with food crops, making it one of India's most promising sustainable fuel options. Its industrial applications now also include alkyd resins, anticorrosion coatings, and inputs for polymer manufacturing.

The seed cake left after oil pressing is not discarded either. Rich in saponins, it is used as an organic fertilizer in farms and, more specifically, as a fish pond treatment in aquaculture — its saponin content selectively removes unwanted fish species to prepare ponds for selective fish farming.

6.3 The Bark and Leaves — The Tree's Medicine Cabinet

The bark of the Ippa tree has been used in folk medicine for as long as the tree has been known. Boiled into a decoction and

ISSN (Online): 2455-3662
EPRA International Journal of Multidisciplinary Research (IJMR) - Peer Reviewed Journal
Volume: 12| Issue: 4| April 2026|| Journal DOI: 10.36713/epra2013 || SJIF Impact Factor 2026: 8.753 || ISI Value: 1.188

applied to the skin, it treats ulcers, eczema, and fungal infections. Taken internally, it is used to reduce fever and manage arthritis. Modern pharmacological studies have validated these traditional uses, showing that bark extracts have significant anti-inflammatory, analgesic, and antidiabetic properties.

The leaves serve as fodder for goats and sheep in the dry season. More notably, the Ippa tree's leaves are the food plant for the tassar silk moth — Antheraea paphia — whose cocoons produce tassar silk, a rich, textured wild silk that has been woven into sarees and fabrics for centuries in Jharkhand, Odisha, and Chhattisgarh.

6.4 The Timber

The wood of the Ippa tree, while not the hardest of timbers, is dense, durable, and notably resistant to termites. Tribal communities have used it for generations to build the frames of houses, to craft agricultural implements, to make wheels for bullock carts, and to fashion the wooden components of traditional oil presses. It is also used as fuel wood and for charcoal production.

6.5 The Tree as an Ecological Anchor

The Ippa tree is not just useful to people. It anchors the ecology of the forests it inhabits. Its extensive root system holds soil on hillsides and slopes, preventing erosion. Its thick canopy shades the forest floor, keeping moisture in and temperature down. Its fragrant flowers, produced in extraordinary abundance, are a critical food source for bees, butterflies, night moths, civets, bears, and a host of other forest creatures. It is, in the truest sense of the word, a keystone species — remove it and the forest changes fundamentally around the gap it leaves.

7. THE IPPA TREE AS MEDICINE — FROM ANCIENT PRESCRIPTIONS TO MODERN SCIENCE

Long before pharmaceutical companies and laboratories, the Ippa tree was India's pharmacy for millions of forest-dwelling people. Every part of the tree appears in traditional medicine, and in the past few decades, scientists have gone back to those traditions and tested them — finding, again and again, that the tribal healers knew what they were talking about.

7.1 What the Flowers Can Do

- Rich in Vitamin C — the body's frontline antioxidant; boosts immunity and helps absorb iron from food
- Carotene (Vitamin A precursor) — supports night vision, skin health, and protection of mucous membranes
- Cooling agent (Sheeta Virya in Ayurveda) — reduces internal heat; treats piles, burning sensations, and heat stroke
- Augments breast milk in nursing mothers — tribal women have known this for generations; flower juice given to lactating mothers to increase milk supply
- Relieves bronchitis, tonsillitis, and pharyngitis — anti-inflammatory and soothing to the respiratory tract
- Treats diarrhoea and dysentery — astringent and antimicrobial properties help calm irritated bowels
- Headache relief — flower paste applied externally to the forehead
- Aphrodisiac — mentioned in classical Ayurvedic texts as strengthening vitality

7.2 What the Bark Can Do

- Anti-inflammatory — aqueous and alcoholic extracts significantly reduce swelling; validated by controlled pharmacological studies
- Analgesic — pain-relieving properties comparable to standard anti-inflammatory drugs in laboratory studies
- Antidiabetic — methanolic bark extract lowers blood glucose levels; being studied as a natural support for diabetes management
- Antibacterial — active against both gram-positive and gram-negative bacteria
- Hepatoprotective — protects liver cells from toxin-induced damage; strengthens the liver wall
- Treats skin diseases and chronic ulcers — bark decoction applied externally

7.3 What the Seeds and Oil Can Do

- Relieves rheumatism and joint pain — warm oil massage has been a tribal treatment for arthritis for generations
- Laxative — gentle internal use of the oil relieves chronic constipation
- Skin emollient — soothes dry skin, eczema, and dermatitis; effective moisturiser
- Anti-epileptic — methanolic leaf extract induces the release of GABA, the brain's calming neurotransmitter, helping regulate abnormal electrical activity in epilepsy
- Anti-parasitic — effective against intestinal worms; 60 mg of methanolic extract has been shown to clear worm infections
- Anticancer potential — leaf extracts show cytotoxic activity against Ehrlich Ascites Carcinoma (cancer) cell lines in laboratory studies
- Antioxidant — rich in flavonoids and triterpenoids that neutralise the free radicals linked to ageing and chronic disease

7.4 The Chemistry behind the healing

Modern phytochemical analysis has identified why the Ippa tree heals as effectively as it does. The tree contains a rich mixture of saponins, sapogenins, triterpenoids, steroids, flavonoids, glycosides, tannins, alkaloids, phenolic compounds, and a full complement of vitamins and minerals. Together, these compounds explain the tree's documented antibacterial, antifungal, anticancer, hepatoprotective, antiulcer, antidiabetic, anti-inflammatory, analgesic, antioxidant, and anti-epileptic activities. It is a natural pharmacopoeia growing out of a single trunk.

Volume: 12| Issue: 4| April 2026|| Journal DOI: 10.36713/epra2013 || SJIF Impact Factor 2026: 8.753 || ISI Value: 1.188

8. IPPA SARA AND IPPA LADDU — THE TREE ON THE TABLE

8.1 Ippa Sara — Mahua Liquor: More Than a Drink

Ask any elder in a tribal village in Chhattisgarh or Andhra Pradesh what the Ippa tree means to them, and somewhere in their answer will be Ippa Sara — the liquor distilled from Mahua flowers. Called Mahua daru, Mahuli, or simply the country spirit of the forests, this is one of the oldest fermented drinks in South Asian history, with references stretching back over 2,500 years in Buddhist, Jain, and Hindu literature.

The making of Ippa Sara is not a rushed process. It is a ritual. Flowers are gathered at first light, before the sun dries them out. They are spread on clean cloth and left to dry in the sun for several days. Once dried, they are soaked in water in earthen pots and left to ferment naturally for five to seven days — the natural sugars in the flowers feeding wild yeasts in the air. The fermented mash is then distilled in traditional copper pot stills, producing a clear, fragrant liquid with about 15 to 25 percent alcohol content. It carries the perfume of the flowers in every drop, softened by the earthiness of the distillation vessel.

> *"For us, the Ippa Sara is not alcohol. It is our puja, our wedding ritual, our celebration, our medicine, and our memory of who we are. Without it, half of our ceremonies would have no meaning." — Elder, Koya community, Andhra Pradesh*

Ippa Sara is consumed at weddings, harvest festivals, funerals, and community gatherings. Small quantities are offered to ancestors during rituals. Elders drink it as a warming tonic against the cold and as a joint pain remedy. It is shared between neighbours as a gesture of hospitality and goodwill.

For most of the colonial period, home distillation of Mahua liquor was either banned or heavily taxed — a wound that tribal communities still remember. Today, several Indian states have relaxed these restrictions, recognising Mahua liquor as a part of tribal cultural heritage and legalising its production under tribal rights legislation. A new wave of craft distillers has begun bringing Mahua spirit to urban and international markets, positioning it as India's answer to mezcal or cachaca — an artisanal, culturally rooted indigenous spirit with a story as deep as the forests it comes from.

8.2 Ippa Laddu — The Sweet That Nourishes

If Ippa Sara is the tree's gift to celebration, Ippa Laddu is its gift to everyday nourishment. Made from dried Mahua flowers ground into a powder and bound with jaggery, sesame seeds, groundnuts, and desiccated coconut, these small round sweets pack an extraordinary amount of nutrition into a very modest package.

Tribal women in Nandurbar, Maharashtra, began making Mahua Laddu commercially as part of self-help group enterprises when they noticed that the very forests around them contained a solution to the child malnutrition that was affecting their villages. The laddus are now given to schoolchildren in several tribal districts as a nutritional supplement — and they are popular precisely because they taste delicious.

Today, Mahua Laddus are available on major Indian e-commerce platforms including Amazon.in, sold by brands such as Aazol Ventures, OOO Farms, and Tribals Bazaar. They are marketed as a forest superfood — gluten-free, free from refined sugar (the sweetness comes entirely from the dried Mahua flowers and jaggery), and rich in iron, calcium, and natural energy.

How to Make Ippa Laddu at Home

Here is a simple, traditional recipe handed down through generations:

- Dried Mahua (Ippa) flowers — 100 g
- Sesame seeds (Til) — 50 g
- Jaggery (Gul) — 80 g, grated
- Roasted groundnuts (peanuts) — 30 g, roughly crushed
- Desiccated coconut — 20 g
- Green cardamom — 4 to 5 pods, crushed
- Optional: cashew, almond, dried fig, a spoon of ghee for a richer version

Method: Dry roast the Mahua flowers and sesame seeds separately on a low flame for 5 to 6 minutes until they are warm and fragrant. Let them cool completely, then grind both into a fine powder. Mix the powdered flowers, sesame, grated jaggery, crushed groundnuts, coconut, and cardamom in a wide bowl. Work the mixture together firmly with your hands until it holds its shape. Roll into small balls. Store in an airtight container — they keep well for two to three weeks.

9. WHAT THE IPPA TREE PUTS ON YOUR PLATE — NUTRITIONAL PROFILE

There is a reason tribal communities gave Mahua flowers to nursing mothers, to children, to the sick, and to people recovering from hard work or illness. Long before anyone had a laboratory to analyse it, they could see what the tree did for people who ate it. Now we have the numbers to confirm what they always knew.

Nutrient	Per 100g Fresh Flowers	Per 100g Dried Flowers
Energy	~111 Kcal	311 Kcal
Carbohydrates	~22 g	72 g
Protein	4.4 g	4.4 – 5.1 g
Fat	0.5 g	1 – 2 g
Dietary Fiber	~2 g	8.2 g
Calcium	100 – 140 mg	140 mg

ISSN (Online): 2455-3662
EPRA International Journal of Multidisciplinary Research (IJMR) - Peer Reviewed Journal
Volume: 12| Issue: 4| April 2026|| Journal DOI: 10.36713/epra2013 || SJIF Impact Factor 2026: 8.753 || ISI Value: 1.188

Iron	~8 – 15 mg	15 mg
Phosphorus	Present	Present
Vitamin C	Present	Present
Vitamin A (Carotene)	Present	Present
Vitamins B1, B2, B3	Present	Present
Potassium	Present	Present

That 15 mg of iron per 100 grams of dried Mahua flower is striking — spinach, celebrated for its iron content, contains about 3 mg. The calcium level of 140 mg per 100 g is comparable to many dairy products. The full range of B vitamins, Vitamin C, and Vitamin A precursors makes the flower a genuinely complete micronutrient source.

Looking at Ippa Laddu specifically, a 100-gram serving provides approximately 395 kilocalories of energy, 53.5 grams of carbohydrates, 17.8 grams of fat, 5.1 grams of protein, and 8.2 grams of dietary fibre. It is dense, sustaining food — the kind of thing that keeps a field worker going through a long morning or a child alert through a school afternoon. And because its sweetness comes from natural flower sugars and jaggery rather than refined white sugar, it releases energy steadily rather than in a spike and crash.

Key Health Benefits — What the Nutrients Do

- Iron (15 mg/100g) — fights anaemia; critically important in tribal and rural populations where iron deficiency is widespread, especially among women and children
- Calcium (140 mg/100g) — builds strong bones and teeth; supports muscle function and nerve signalling
- Vitamin C — boosts immunity, accelerates wound healing, and doubles the body's absorption of iron from plant sources
- Vitamin A via Carotene — protects eyesight, especially night vision; maintains healthy skin and a strong immune barrier
- B Vitamins (B1, B2, B3) — essential for converting food into energy; support nerve function and red blood cell production
- Dietary Fibre (8.2 g/100g) — feeds healthy gut bacteria, prevents constipation, and slows the absorption of sugar into the bloodstream
- Natural sugars — rapid, clean energy without the harmful effects of refined sugar
- Cooling Ayurvedic property — classified as Sheeta Virya; beneficial in tropical climates for preventing heat-related illness
- Lactation support — raw flowers given to nursing mothers traditionally to increase and enrich breast milk; a practice now supported by nutritional evidence
- Pregnancy and postpartum — high iron and calcium content make Mahua products an excellent natural support for maternal health before and after childbirth

10. LIVELIHOODS, ECONOMY, AND THE FUTURE

The Ippa tree is not just personally important to the families who gather its flowers — it is an economic engine for millions of people. According to the Government of India's Ministry of Tribal Affairs, Mahua flowers and seeds contribute between Rs 3,000 and Rs 5,000 crore annually to the tribal economy. And that number reflects only the formal, documented trade — the real contribution, including home use and informal barter, is certainly much higher.

For many tribal households in Chhattisgarh, Jharkhand, Odisha, and Andhra Pradesh, the two months of Mahua flower collection — February through April — account for 25 to 40 percent of the entire family's annual income. A single mature Mahua tree can yield 200 to 250 kilograms of flowers in a good season. For a family that tends ten or twenty such trees, this is a meaningful harvest.

The value chain built around the Ippa tree is long and diverse. It begins with flower and seed collection — primarily done by tribal women, who are the primary custodians of Mahua knowledge in most communities. It continues through drying and processing, oil pressing, soap and detergent manufacture, liquor distillation, and now an expanding range of branded food products: laddus, barfi, jam, wine, biscuits, and health supplements. At every step, there are jobs, there is income, and there is a living connection to a tradition that goes back thousands of years.

India produces an estimated 0.5 million tonnes of Mahua seeds annually in southern India alone — a resource still largely untapped compared to its potential. As global markets grow for natural cosmetics (where Mahua oil is finding increasing interest as a premium moisturiser and hair oil ingredient), for artisanal spirits, and for biodiesel alternatives, the Ippa tree stands on the threshold of a commercial renaissance that could transform the livelihoods of millions of forest communities.

11. THE CHALLENGES AHEAD — PROTECTING THE TREE THAT PROTECTED US

It would be easy, reading through everything the Ippa tree gives, to assume that it is thriving and safe. But the truth is more complicated. While the tree is not yet officially listed as endangered, its numbers are declining in several regions, and the threats are real and growing.

Rapid deforestation for agriculture, mining, and road construction has removed many old Mahua groves. Overexploitation — collecting more flowers and seeds than the tree and the ecosystem

can sustain — has weakened trees in high-pressure areas. Uncontrolled grazing has prevented young saplings from establishing themselves. Climate change is beginning to disrupt the flowering patterns that tribal communities have relied on for generations.

And there is a subtler threat: the loss of knowledge. As younger generations move to cities in search of work and education, the deep, accumulated wisdom about the Ippa tree — which trees are ready for harvest, how much to take without damaging the tree, how to press the oil, how to distil the Sara, how to make the Laddu exactly right — is in danger of fading away.

Responses to these threats are emerging from multiple directions. Conservation groups in Mumbai have launched campaigns to plant Mahua trees in Aarey Forest. State governments in Chhattisgarh and Jharkhand have included Mahua plantation in social forestry programs. NGOs and tribal cooperatives are training young tribal people in Mahua-based enterprises so that the tree continues to provide livelihoods as well as ecological services. And scientists have called for something long overdue: systematic cultivation of the Ippa tree, including the development of higher-yielding, earlier-flowering varieties through selective breeding, so that this extraordinary tree can give even more.

12. CONCLUSION

There is a quiet kind of wisdom in the Ippa tree. It does not shout. It does not demand attention. Every year, in February and March, it simply opens its flowers, fills the forest with perfume, and rains its abundance down for those who come to gather it. It has been doing this for tens of millions of years. It was doing it long before the first human hands reached down to collect those sweet, creamy flowers from the dawn-damp ground.

But the Ippa tree's story is not just a story about a tree. It is a story about a different way of living — one in which a community and a forest species grow up together over centuries, each shaped by the other, each sustaining the other. The tribal communities who tended the Mahua tree did not think of themselves as managing a resource. They thought of themselves as members of a family that included the tree. And the tree, for its part, kept giving.

Today, as India looks for ways to address rural poverty, nutritional deficiency, land degradation, and the challenge of building a more sustainable economy, the Ippa tree offers real, tested, culturally rooted answers. Its flowers feed children who need iron. Its oil can power vehicles without new fossil fuels. Its bark medicines are now being confirmed by laboratories. Its liquor tradition, properly regulated and supported, can be a premium Indian cultural export. Its very presence on the land prevents erosion and sequesters carbon.

The Ippa tree is the Kalpavriksha — the wish-fulfilling tree — of India's tribal communities. But perhaps its gifts are not just for tribal communities. Perhaps, if we are wise enough to listen to what this tree has been quietly saying for three thousand years, it can help all of us find a way forward that is more sustainable, more nourishing, and more deeply rooted than anything we can build from scratch.

> *"The Mahua tree is not just our livelihood. It is our library, our pharmacy, our temple, and our ancestor. Every time we gather its flowers, we are receiving a gift from the forest. And every time we protect it, we are leaving a gift for our children."*
